Project 2:

Genomic background effects in psychiatric disorders

Jędrzej Kubica

Mentors: Nicolas Thierry-Mieg, Sébastien Déjean

Brainhack Warsaw

April 17, 2026

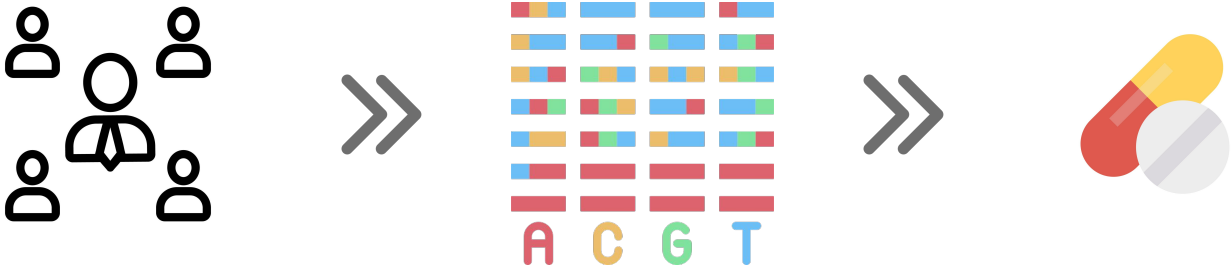
Motivation

- Genotype-phenotype interactions
- Secondary factors, e.g. **genomic backgrounds** (combinations of common variants within specific haploblocks)
- Most effective intervention points and treatments

Project aim

Build a **bioinformatics pipeline:**

1. to characterize and compare genomic backgrounds associated with psychiatric disorders or Alzheimer’s disease
2. to associate them with most promising drugs



Example public resources

- 1000 Genomes Project
- ClinVar database
- Open Targets Platform
